Lab09 实验报告

1.post 实现方法：

```
HttpClient httpClient = new DefaultHttpClient();
        HttpPost post = new HttpPost(baseUrl);
        List<NameValuePair> params = new ArrayList<NameValuePair>();
        params.add(new BasicNameValuePair("mobileCode", number));
        params.add(new BasicNameValuePair("userId", ""));

        try {

            post.setEntity(new UrlEncodedFormEntity(params, HTTP.UTF_8));
            HttpResponse httpResponse = httpClient.execute(post);
            if (httpResponse.getStatusLine().getStatusCode() ==
HttpStatus.SC_OK) {
                // 解析返回的内容
                String result =
EntityUtils.toString(httpResponse.getEntity());
                // 将查询结果经过解析后显示在TextView中
                mHandler.obtainMessage(1,result).sendToTarget();
            }

        } catch(Exception e) {
            e.printStackTrace();
        }
```

2.实现手机归属地查询：
